The invention relates to a method and an apparatus for allocating time slots to circuit-switched channels established to comprise one or more respective time slots in a recurrent frame of a time division multiplexed network.

The object of the invention is to provide a flexible way of controlling the allocation and deallocation of time slots to channels, also taking into consideration the situation when there are no free slots available.

According to the invention, a time slot allocated to said channel is associated with a selected level, of at least two available levels, of priority. Decisions as to whether or not to deallocate said time slot from said channel is then based upon a comparison of said selected level of priority and a level of priority associated with a request for a time slot for another channel.

Continuation of: V

However, the documents D1-D6 do not disclose such a method or apparatus, but reveal only the general state of the art.

Therefore, the invention claimed in claims 1-30 is considered to be novel (N), to involve an inventive step (IS) and also to have industrial applicability (IA).

(57) Abstract

The present invention relates to methods and apparatuses for allocating time slots to circuit-switched channels established to comprise one or more respective time slots in a recurrent frame of a time division multiplexed network. According to the invention, a time slot allocated to said channel is associated with a selected level, of at least two available levels of priority. Decisions as to whether or not to deallocate said time slot from said channel is then based upon a comparison of said selected level of priority and a level of priority associated with a request for a time slot for another channel.
